Privacy and Internet

When an email is sent on Internet or is exchanged on the corporate network, it is read on all computers on its route : your colleagues, Internet Service Providers, routers, organisations having access to the resources of the global Internet network, the co-workers of your correspondent...

To protect the privacy of professional exchanges and the security of the company, it is necessary to protect the data exchanges.

Easy and immediate Encryption

CryptoMailer is the first encryption tool as easy to install as it is to use. CryptoMailer works without certificate, PKI, complex management of keys, nor definition of security profiles.

CryptoMailer makes it possible to create encrypted and protected e-mails immediately after its installation.

Decryption is even easier !

Don't your correspondents have CryptoMailer?

CryptoMail Reader is a FREE product. This version allows users to decrypt files encrypted with CryptoMailer. You just need to share the password with your correspondent.

Functionalities

- CryptoMailer allows you to encrypt files and memos, either to protect them before sending them by e-mail, or to store them securely on your hard disk.
- To encrypt a file, open CryptoMailer, choose a key and select an action: local encryption or e-mail transmission. The file selection can also be done within CryptoMailer, by a "drag & drop" or using the contextual menu in Windows Explorer.
- File decryption is extremely easy. Double-click on the file, then choose the action : local decryption with automatic opening of the file, or decryption under a selected directory.
- CryptoMailer offers an extremely easy management of keys frequently used.

Cryptography

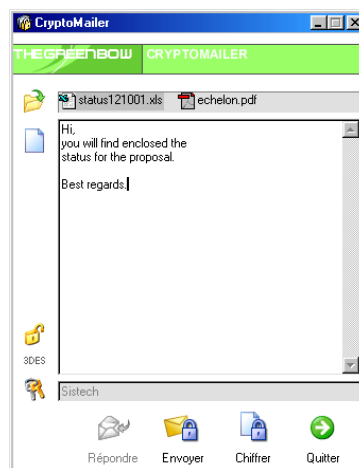

CryptoMailer implements 3DES CBC 128 bits or AES encryption and MD5 signature.

A 128 bits key is randomly generated for each encryption.

Using CryptoMailer

CryptoMailer is very user-friendly. Most of its functions can be accessed in a single click.

- « One-click-mail » function : just one click to open your e-mail client and send the encrypted e-mail.
- With CryptoMailer, decrypt and open files with a unique click.
- Selection of the keys is displayed in a drop-down menu. Keys management is particularly simplified thanks to the dedicated control panel.

CryptoMailer under Windows

CryptoMailer is fully integrated in Windows

- clean and standard Install and Uninstall
- Use of the "drag & drop" to define files to encrypt.
- CryptoMailer entries in Windows Explorer right-click menus
- Automatic creation of shortcuts

Compatibility

CryptoMailer works on Windows 95, 98, ME, NT4, 2000, XP.

CryptoMailer is compatible with all e-mails clients on the market: Outlook, Outlook Express, Eudora, Pegasus, Lotus Notes, Netscape Messenger, etc...
